St. Louis, Missouri

PERFORMANCE EVALUATION REPORT

ON

APACHE WEB SERVER AND MYSQL PERFORMANCE EVALUATION

**(CSE 503S RAPID PROTOTYPE DEVELOPMENT AND CREATIVE
PROGRAMMING, SPRING 2017)**

Submitted By:

Swetha Reddy Nathala

Deeksha Chaudhary

1. EXPERIMENTAL SETUP

1.1 INTRODUCTION

Amazon t2 instances don't use the full CPU often or consistently, but occasionally need to burst to higher CPU performance. T2 instances are backed by the latest Intel Xeon processors with clock speed up to 3.3 GHz during burst periods. We selected 2 t2 instances to evaluate Apache web server and MySQL database.

t2.micro has 1 virtual CPU (physical central processing unit (CPU) that is assigned to a virtual machine) and 1 GB memory. On the other hand, t2.xlarge has 4 virtual CPUs and 16GB memory.

Apache Web Server Performance Evaluation:

We used ApacheBench (ab) tool to evaluate the performance of Apache web server on t2.micro and t2.xlarge instances.

ApacheBench is a very handy web server benchmarking tool which can be run from command line. It is extremely simple to use and no complex setup is required. It gets installed automatically with apache. It is a single threaded command line computer program for measuring the performance of HTTP web servers. Originally designed to test the Apache HTTP server, it is generic enough to test any web server.

To test the web server, we created 2 html files. Image.html file displays 6 **images**, whose total size is 3 MB.

```
<body>
  <div id="main">
    <img id = 'bgimg1' src = "brookings.jpg" alt = "img">
    <img id = 'bgimg2' src = "boston.jpg" alt = "img">
    <img id = 'bgimg3' src = "MIT.jpg" alt = "img">
    <img id = 'bgimg4' src = "NYU.jpg" alt = "img">
    <img id = 'bgimg5' src = "USC.jpg" alt = "img">
    <img id = 'bgimg5' src = "UW.jpg" alt = "img">
  </div>
</body>
```

Video.html plays a **video** (mp4) of size 458 MB.

```
<body>
```

```
<div id="main">
  <video width="320" height="500" autoplay>
    <source src="cse330Lecture6.mp4" type="video/mp4">
    Your browser does not support the video tag.
  </video>
</div>
</body>
```

MySQL Database Performance Evaluation:

Sysbench can be used to perform load testing on mysql server. It is a modular, cross-platform and multi-threaded benchmark tool. Sysbench runs a specified number of threads and they all execute requests in parallel. Sysbench OLTP helps to estimate best case scenario MySQL performance. **It is possible to simulate read only workloads, by using select queries or test mixed read and write environments.**

1.2 INSTALLATION AND SETUP

1.2.1 STEPS TO INSTALL SYSBENCH

Execute following commands to install Sysbench in aws instance (both t2.micro and t2.xlarge).

- yum install mysql-devel -y
- wget <http://pkgs.fedoraproject.org/repo/pkgs/sysbench/sysbench-0.4.12.tar.gz/3a6d54fdd3fe002328e4458206392b9d/sysbench-0.4.12.tar.gz>
- tar zxvf sysbench-0.4.12.tar.gz
- yum install libtool.x86_64 openssl-devel.x86_64 openssl-static.x86_64
- cd sysbench-0.4.12/
- libtoolize --force --copy
- ./autogen.sh
- ./configure
- make
- sudo make install

1.2.2 SETUP MYSQL DATA REQUIRED FOR SYSBENCH:

Login to MySQL and create a new database.

```
##Create Database
```

```
CREATE DATABASE sysbench;
```

Once you have created the test database, run the command below to fill up the database with some data. It creates a database that is about 2GB in size.

```
sysbench --test=oltp --db-driver=mysql --oltp-table-size=10000000 --mysql-db=sysbench  
--mysql-user=username --mysql-password=pwd prepare
```

1.2.3 PERFORMANCE TESTING

Read-only OLTP tests:

Execute below command to run a Read-Only Sysbench OLTP test. This will run OLTP tests at various thread levels to get an idea of how MySQL will perform under certain workloads. This test will start off running a single threaded OLTP read only test, then run a 4 threaded OLTP read only test, and will continue to do that until the 64 threaded test has finished.

```
for each in 1 4 8 16 32 64; do sysbench --test=oltp --db-driver=mysql  
--oltp-table-size=10000000 --mysql-db=sysbench --mysql-user=sysbench  
--mysql-password=password --max-time=240 --max-requests=0 --oltp-read-only  
--num-threads=$each run; done
```

Mixed Read and write OLTP tests:

Read and Write OLTP Mixed Test. Usually about 70% read (select) and 30% write (insert, update, delete)

```
for each in 1 4 8 16 32 64; do sysbench --test=oltp --db-driver=mysql  
--oltp-table-size=10000000 --mysql-db=sysbench --mysql-user=sysbench  
--mysql-password=password --max-time=240 --max-requests=0 --num-threads=$each run;  
done
```

2. EXPERIMENTAL RESULTS CONTAINING MULTIPLE DATA POINTS AND TWO DIFFERENT TYPES OF DATA

2.1 APACHE WEB SERVER

2.1.1 INTRODUCTION

2.2.2 INSTANCES

- t2.micro
- t2.xlarge

2.2.3 DATA

- Images
- Videos

2.2.4 TESTS

- Pages per second
- Mean time per request
- Mean time per request across all concurrent requests

(i) Images

- **On t2.micro**

```

2.2 MySQL Database

2.1.1 INTRODUCTION

2.2.2 INSTANCES

- t2.micro
- t2.xlarge

2.2.3 DATA

- Read only (1, 4, 8, 16, 32 and 64 threads)
- Read and Write (1, 4, 8, 16, 32 and 64 threads)

2.2.4 TESTS

- read/write per second
- Number of transactions per second

(i) Read Only

- On t2.micro

Number of threads - 1

```
Running the test with following options:
Number of threads: 1

Doing OLTP test.
Running mixed OLTP test
Doing read-only test
Using Special distribution (12 iterations, 1 pct of values are returned in 75 pct cases)
Skipping BEGIN/COMMIT
Using auto_inc on the id column
Threads started!
Time limit exceeded, exiting...
Done.

OLTP test statistics:
  queries performed:
    read:          58534
    write:         0
    other:         0
    total:         58534
  transactions:    4181 (17.42 per sec.)
  deadlocks:      0 (0.00 per sec.)
  read/write requests: 58534 (243.85 per sec.)
  other operations: 0 (0.00 per sec.)

Test execution summary:
  total time:      240.0402s
  total number of events: 4181
  total time taken by event execution: 239.6730
  per-request statistics:
    min:          1.02ms
    avg:          57.32ms
    max:          247.84ms
    approx. 95 percentile: 122.80ms

Threads fairness:
  events (avg/stddev): 4181.0000/0.00
  execution time (avg/stddev): 239.6730/0.00
```

Number of threads - 4

```
Running the test with following options:
Number of threads: 4

Doing OLTP test.
Running mixed OLTP test
Doing read-only test
Using Special distribution (12 iterations, 1 pct of values are returned in 75 pct cases)
Skipping BEGIN/COMMIT
Using auto_inc on the id column
Threads started!
Time limit exceeded, exiting...
(last message repeated 3 times)
Done.

OLTP test statistics:
  queries performed:
    read:                188426
    write:                0
    other:                0
    total:               188426
  transactions:        13459 (56.07 per sec.)
  deadlocks:           0 (0.00 per sec.)
  read/write requests: 188426 (784.95 per sec.)
  other operations:    0 (0.00 per sec.)

Test execution summary:
  total time:                240.0484s
  total number of events:    13459
  total time taken by event execution: 958.3586
  per-request statistics:
    min:                    1.01ms
    avg:                    71.21ms
    max:                    454.31ms
    approx. 95 percentile: 201.11ms

sysbench 0.4.12: multi-threaded system evaluation benchmark
```

Number of threads - 64

```
Running the test with following options:
Number of threads: 64

Doing OLTP test.
Running mixed OLTP test
Using Special distribution (12 iterations, 1 pct of values are returned in 75 p
ct cases)
Using "BEGIN" for starting transactions
Using auto_inc on the id column
Threads started!
Time limit exceeded, exiting...
(last message repeated 63 times)
Done.

OLTP test statistics:
  queries performed:
    read:                3103562
    write:               1108415
    other:               443366
    total:              4655343
  transactions:        221683 (923.55 per sec.)
  deadlocks:           0 (0.00 per sec.)
  read/write requests: 4211977 (17547.44 per sec.)
  other operations:    443366 (1847.10 per sec.)

Test execution summary:
  total time:                240.0337s
  total number of events:    221683
  total time taken by event execution: 15360.7152
  per-request statistics:
    min:                     2.01ms
    avg:                     69.29ms
    max:                     846.14ms
    approx. 95 percentile:   178.95ms

  execution time (avg/stddev): 240.0112/0.00
```

2.2.5 EXPERIMENTAL RESULTS

(i) Read Only

- On t2.micro

S. No.	Number of threads	read/write per sec	Number of transactions per sec
1.	1	243.85	17.42
2.	4	784.95	56.07
3.	8	923.08	65.93
4.	16	791.38	56.53
5.	32	763.06	54.50
6.	64	802.41	57.32

- On t2.xlarge

S. No.	Number of threads	read/write per sec	Number of transactions per sec
1.	1	11192.58	799.47
2.	4	46657.00	3332.64
3.	8	45772.79	3269.48
4.	16	37612.59	2686.61
5.	32	46135.39	3295.39
6.	64	45825.66	3273.26

Read/write per second comparison between t2.micro and t2.xlarge for read only mode

Number of transactions per second comparison between t2.micro and t2.xlarge for read only mode

(i) Mixed Mode (Read and Write)

- On t2.micro

S. No.	Number of threads	read/write per sec	Number of transactions per sec
1.	1	245.09	12.90
2.	4	524.31	27.60
3.	8	627.52	33.03
4.	16	684.91	36.05
5.	32	836.44	44.02
6.	64	672.85	35.41

- On t2.xlarge

S. No.	Number of threads	read/write per sec	Number of transactions per sec
1.	1	3675.11	193.43
2.	4	9764.04	513.90
3.	8	13929.46	733.13
4.	16	15785.78	830.83
5.	32	16483.28	867.54
6.	64	17547.44	923.55

Read/write per second comparison between t2.micro and t2.xlarge for mixed mode (read and write)

Number of transactions per second comparison between t2.micro and t2.xlarge for mixed mode (read and write)

3. RESULTS

4.1 APACHE WEB SERVER

Terms to know:

Time per request (mean) tells you the average amount of time it took for a *concurrent* group of requests to process.

Time per request (mean, across all concurrent requests) tells you the average amount of time it took for a *single* request to process by itself.

After analyzing the performance across 12 different configurations and measuring across three measures, we found that when the number of requests and concurrency are high, the performance starts to degrade because apache spawns one thread for each request. This results in a large number of threads, increasing the context switching time and hence, increasing the mean time per request. However, the mean time per request across all concurrent requests is pretty good. So, while increasing concurrency results in better performance, we need to make sure that the context switching time doesn't exceed the actual turn around time using single thread. It also depends upon the type of application you want to build; if the average amount of time to complete a group of requests is a priority, a low concurrency would generally be better. If the average time to process a request is more important for the users, higher concurrency would result in better performance.

2.2 MySQL Database

Terms to know:

Transactions per sec : A transaction is a sequence of operations performed as a single logical unit of work. This measure calculates mean number of transactions that are executed in a sec. It does not reflect the amount of data that is read from or written to a database

read/write per sec: Mean number

We analysed transactions per sec and read/write per sec when data is only read and not updated, using single thread and also multiple threads. We also analysed database performance when data is both read and updated, i.e. mixed mode using single and multiple threads. This analysis was performed on both t2.micro and t2.xlarge instances.

The results show that read operation is faster than write operation. When we increase number of threads, it increases performance initially. But as number of threads increase, due to context switching overhead, performance deteriorates. The same pattern holds when there are more number of CPUs, but both transfer rate and read/write rate is much higher in this configuration.

4. BOTTLENECK OF THE SYSTEM

4.1 APACHE WEB SERVER

The results show that the bottleneck of our system lies with Context Switching. Apache spawns one thread for each request. So, when we have a large number of requests and we increase the concurrency level, the system performance degrades because of the context switching time between the threads.

As the results show, when the number of requests and concurrency are high like in case of 500 requests and 500 concurrency, the performance is the worst. So, while increasing concurrency results in better performance, we would have to make sure that the context switching time doesn't exceed the actual performance using a single thread.

4.2 MySQL Database

In any database, write operation is more expensive than read operation. The results above confirms that this is true for MySQL as well. Results also show that threads increase the performance initially but later it deteriorates. If there are many write requests with large number of threads running concurrently, then the performance deteriorates in a rapid manner.

5. What type of instance or configuration would you recommend

I would recommend using t2.xlarge because overall performance is better in t2.xlarge, for both apache web server and MySQL database. But after selecting the instance, there are many other aspects that a programmer has to take into account to increase the performance, like number of requests that apache server can server concurrently, number of threads in MySQL database. Before deciding the concurrency in both web server and MySQL, we need to estimate the load that is expected in future, i.e. number of requests our application is expected to receive at any given point of time in future.
